# Once upon a time...

there was an optimizing compiler

- x86 → RISC
- Specialized frontend, standard middle-end.
  - Loop optimizations, inlining, peephole, parallelization, CSE, etc...
- Multiple tiers of translation (PGO).
- Overly optimistic with correctness sometimes.
  - Interruptions, etc.
- Backend may also ask to retranslate.

  - Interruptions, etc.
- Backend may also ask to retranslate.

# We want to retranslate functions, a lot but not from the very beginning

# We want to retranslate functions, a lot but not from the very beginning

# Problem

We need to be able to save the IR, and then restore it some time later.

# Outline

## 1 Problem: Transparent save/load.

- Project outline
- Our options?

## 2 Solution: Reflection!

- What is reflection?
- What is DWARF?
- Solution

## 3 Summary

- Looking ahead

# Option 1: Serialization(dumper) functions

- Write save+restore functions for every structure.
- Research project → frequent IR changes → frequent breakage.
- Must enforce proper use.

# Option 1: Serialization(dumper) functions

- Write save+restore functions for every structure.
- Research project → frequent IR changes → frequent breakage.
- Must enforce proper use.

# Option 1: Serialization(dumper) functions

- Write save+restore functions for every structure.
- Research project → frequent IR changes → frequent breakage.
- Must enforce proper use.

## Option 2: Contrived macros

Describe all structures as macro functions, then `#include` them multiple times.

- Hard to read and maintain.
- Confusing for IDEs.
- Hard to debug.
- Must enforce proper use, too!

## Option 2: Contrived macros

Describe all structures as macro functions, then `#include` them multiple times.

- Hard to read and maintain.
- Confusing for IDEs.
- Hard to debug.
- Must enforce proper use, too!

## Option 2: Contrived macros

Describe all structures as macro functions, then `#include` them multiple times.

# Definition

“In computer science, reflection is the ability of a computer program to examine, introspect, and modify its own structure and behavior at runtime.”

# Reflection facilities in different languages.

- Compiled with runtime support
  - `System.Reflection` in C#
  - `java.lang.reflect` in Java
- Interpreted languages
  - JavaScript
  - Python

# What is DWARF?

- “A debugging file format used by many compilers and debuggers to support source level debugging.  
(<http://dwarfstd.org>)”
- Supported by GCC, LLVM, ICC and others.
- Contains information about types, constants, variables, functions, etc.
- All information represented as a graph.
- Node structure = DIE (Debugging Information Entry)
  - Tag = node type
  - Attribute = contents

# What is DWARF?
